

Prompt: The figure presents a five-step procedural workflow for analyzing Software Requirements Specifications (SRSs) to generate a Rimay Grammar, depicted as a vertical flowchart with clear directional arrows indicating the sequence of operations. The global layout is structured from top to bottom, beginning with an input source at the top and progressing through five numbered processing stages to produce a final output at the bottom. Each stage is represented by a rounded rectangular module labeled with a number and descriptive title, accompanied by small icons indicating whether the step is automated (gear icon) or involves human intervention (person icon). Inputs and outputs are shown as square boxes with illustrative icons and labels. At the top, the process begins with an input box labeled 'SRSs', containing an icon of stacked blue documents, which feeds into Step ①: 'Extract Requirements'. This step is marked with a gear icon, indicating automation, and produces an output labeled 'Requirements', shown as a box with horizontal lines representing a list. From here, the flow proceeds to Step ②: 'Identify Codes', which includes both a gear and a person icon, suggesting a semi-automated process involving human oversight. This step takes the 'Requirements' as input and generates two outputs: 'Dictionary of Codes', depicted as a red book icon, and continues to Step ③. Step ③, 'Label Requirements', features only a person icon, indicating it is a manual task. It receives inputs from both the 'Dictionary of Codes' and the 'Requirements' (via the 'Labelled Requirements' intermediate output), and produces 'Labelled Requirements', shown as a list with colored dots beside each line, symbolizing categorized entries. This output then flows into Step ④: 'Group Requirements', which again combines a gear and person icon, implying collaborative human-machine effort. The output of this step is 'Requirements by Label', illustrated as a grid with colored squares arranged in quadrants, representing grouped data. Finally, Step ⑤: 'Create Grammar', marked with a person icon, takes 'Requirements by Label' as input and produces the final output: 'Rimay Grammar', displayed as a computer monitor showing code-like text. All connections between modules are represented by solid black arrows, clearly indicating the direction of data flow. The entire diagram uses consistent visual styling: white backgrounds with black borders for all boxes, bold black text for titles, and simple, universally recognizable icons to denote automation and human involvement. The figure effectively communicates a hybrid methodology combining automated extraction with iterative human-driven coding, labeling, grouping, and grammar creation.
